The place of archaeology in integrated cultural landscape management

A case study comparing landscapes with Iron Age oppida in England, France and Spain

Abstract

Across Europe, landscape is recognised as a frame through which societal values are defined and embedded. The European Landscape convention and wider research has drawn attention to the need for integrating a diverse range of stakeholders to ensure landscape sustainability. Archaeology is increasingly recognised as having an important place in integrated landscape management but often remains relatively peripheral. This paper examines the place of archaeology in specific European regions and the potential ways of integrating archaeological heritage in landscape management. Emerging from a project funded by the Joint Programme Initiative on Cultural Heritage (Resituating Europe’s First Towns (REFIT): A case study in enhancing knowledge transfer and developing sustainable management of cultural landscapes), we explore the place of a set of common European heritage assets, Iron Age oppida, in the management of the landscape they are a part of and how they might be used better to engage and connect stakeholders. Using four case studies, we review the present integration of archaeology within landscape management and how this operates at a local level. From this we explore what challenges these case-studies present and outline ways in which the REFIT project has sought to develop strategies to respond to these in order to enhance and promote co-productive management of these landscapes.

Keywords

archaeology, oppida, stakeholders, coproduction, integrated management, cultural ecosystems services, cultural landscape, sustainability

Introduction

Across Europe, landscape is recognised as a frame through which societal values are defined and embedded.¹ The concept of cultural landscape as defined by UNESCO² emerged from wider European traditions³ on the need to emphasise the interconnections between natural and cultural factors in creating landscape character. More recently, the European Landscape convention (ELC)⁴ has drawn more attention to the perceptive nature of landscape and the need for integrating a diverse range of stakeholders and values to ensure landscape sustainability. Archaeology as a discipline increasingly recognises that it should be integral to such approaches, not just as evidence from the past, but contributing to current and future environments.⁵ As national and European agendas advocate integration,⁶ detailed assessments of the current place of archaeological heritage at a local level are increasingly necessary if archaeology is to be embedded in holistic landscape management.⁷

Developing from these concerns, this paper examines the place of archaeology in specific European environments and the potential ways of integrating archaeological heritage in landscape management. In this paper we consider ‘landscape’ in similar terms to that in the ELC, recognising that ‘cultural landscape’, as it has been defined by UNESCO,⁸ has tended to somewhat under-estimate the perceptive aspect of landscapes as developed more
recently. Emerging from a project funded by the Joint Programme Initiative on Cultural Heritage (Resitutating Europe’s First Towns: A case study in enhancing knowledge transfer and developing sustainable management of cultural landscapes: http://www.refitproject.com), we explore the place of a set of common European heritage assets, Iron Age oppida located in France, England and Spain, in the management of the landscape they belong to and how they might be better used to engage and connect stakeholders.

Using four case studies, this paper reviews the present integration of archaeology within landscape management and how this operates at a local level. This is followed by an exploration of the specific challenges faced in integrating these monuments and how this has influenced us to take a coproductive approach, developing strategies to enhance archaeology as a lever to promote integrated landscape management.

Integrated cultural landscape management

Whilst ‘cultural landscapes’ were relatively tightly defined by UNESCO, the ELC took a broader approach, emphasising that all landscapes are a product of human and natural interaction and emerge as much from the perception and perspective of human agents as from their materiality. The ELC also recognised that crucial to their value is the improved quality of life they bring, coinciding with increasing recognition of heritage as a social benefit. These developments emerged alongside recognising the need to include communities in decision making. This ‘principle of participation’, reinforced by the 1998 Aarhus Convention, and echoed in the right to heritage under the Faro Convention emphasised that diverse stakeholders should be integral to landscape and heritage management. In our approach to landscape we seek to go somewhat further than the ELC, drawing on concepts of ‘Natural Capital’, ‘public goods’, and ideas of landscape as ‘commons’, which have attempted to build ecosystems services into assessments of landscape value. As part of this broader interpretation of landscape, the importance of cultural ecosystems services are perceived not as separate elements but integral to landscape biographies. Many such approaches recognise, as we do, the intangibility of ‘landscape’ in which the perceptions, memories and identities of all its actors are engrafted as part of those landscape biographies.

These perspectives on landscape have emerged at a time when European territories face a variety of pressures, ranging from the impacts of climate change, rural depopulation, declining rural economies and changing farming practices. At the same time, in a contested, globalised world, landscape is a frame of reference for local, regional and national identities. Landscape, and the archaeology within it, have significant potential as, what has been recently defined in debates in the UK as a ‘public good’, in other words contributing to broadly defined aspects of community well-being (cultural, physical, mental and social). Requiring collective definition and understanding of the factors that influence their character, landscape can form an arena that engages inhabitants in public life. In so doing, it can embed stakeholders in a transversal approach to public action, including engagement with agriculture, tourism, energy, transport and heritage. In many cases, archaeology has untapped potential to act as a lever to facilitate such engagement.

Recognition of the importance of stakeholder participation means that integrated management and landscape sustainability are increasingly regarded as mutually dependent. Definitions of integration vary, however. Integrating academics and policy makers has been a focus of European agendas but engagement with more diverse stakeholders has not always been widespread. A paradigm shift is occurring, however, with realisation of the need to incorporate all stakeholders within landscape management. Stakeholders can be defined very broadly, including farmers, business, ecologists and residents, but also all those who feel an attachment with a landscape (tourists, heritage professionals and the wider public) to whom, for example, it might relate to their identity.

Integration requires participation and coproduction, emphasising a share of power in decision making. Landscapes can be contentious and coproduction need not impose unanimity but allows exploration of ‘trade-offs’ between stakeholder values. In this approach, sustainability is not a contrast between preservation and exploitation but emphasises landscape dynamism, allowing stakeholder participation in defining landscape character and direction. Although cultural heritage is increasingly an aspect of integrated management, archaeology has not always been fundamental to such processes. For European oppida, the REFIT project recognised an opportunity to explore whether that place could be enhanced, alongside other interests and values, to underpin these particular landscapes’ sustainability.

Oppida, a pan-European case study in cultural landscape management

The large Iron Age monuments known as oppida, found across western and central Europe (Fig. 1), represent a particular challenge for heritage management. Their scale, often covering 100s of hectares, means that, archaeologically, oppida have to be considered as man-made territories. Whilst recognising (above) that all heritage is an integral element of landscape, oppida are unusual in involving archaeologists (and other stakeholders) to engage with heritage as integral to the landscape, not as ‘sites’ divorced from it.

From different motivations (Álvarez Sanchís and Moore as researchers, Guichard as director of a research centre, tourist site and museum) we recognised that managing these monuments requires a landscape perspective. The often relatively non-spectacular archaeological remains and their scale means oppida are frequently
Figure 1. Approximate distribution of monuments known as ‘oppida’ across Europe with the location of the case study landscapes (drawn by Tom Moore).

working areas with few able to be preserved only as heritage monuments (Fig. 2). In addition, despite their significance for Europe’s cultural heritage (arguably representing temperate Europe’s first urbanism) oppida are poorly recognised as significant heritage assets and underdeveloped as foci for cultural and economic sustainability. This means that even when they receive high-level protection they continue to balance the needs of heritage management with other landscape requirements. Landscapes with oppida within them are, therefore, a useful focus with which to compare current approaches and the practicalities of integrated approaches. As a pan-European phenomenon, oppida also represent a heritage asset which has a (largely untapped) potential act as focus for trans-national comparison and cooperation. To undertake assessment of landscapes in which oppida are integral, four examples were chosen, two in England (Salmonsbury and Bagendon, Gloucestershire), one in France (Bibracte, Burgundy) and one in Spain (Ulaca, Ávila) (Fig. 1). These reflect the diversity of oppida whilst emphasising the range of pressures on them. The project aimed to work less on disseminating archaeological knowledge, although this was an aspect, but more to explore methods of knowledge exchange...
between stakeholders. As part of the project we undertook analysis of stakeholder perceptions and developed methodologies to engage stakeholders, which are discussed in more detail elsewhere. Underpinning these is our assessment of the current state of integration of landscape management at our case studies and the challenges these present.

**Current integration of archaeology in landscape management**

The place of archaeology in local landscape management can only be understood in its juridical context. All three of our partner countries are signatories to the European Landscape convention and Valletta convention. These acts as the basis from which most European countries are aligning their approaches to managing landscape. Similarly, although none of our countries are yet signatories to the Aarhus Convention, they acknowledge the value and potential of cultural heritage as a resource for sustainable development and quality of life. Commitment by all countries to the Aarhus Convention also includes a need for public participation within environmental matters. Despite these underpinnings, the reality of how archaeology is connected to landscape management varies considerably. Also significant is the varied impact of the development of national approaches to landscape and heritage.

**The English framework**

The ELC informs England’s approaches to landscape management although archaeology’s integration is more complex. The core mechanism for managing the quality of rural territories is through Natural England which oversees agri-environment subsidy schemes (Countryside Stewardship), which provide options for management of the environment, including the historic environment, on behalf of the Department for Environment, Food and Rural Affairs (DEFRA). Management of heritage and archaeology is covered by two core areas of legislation. The Ancient Monuments Areas Act (1979), enforced by a government agency (Historic England), legally protects ‘Scheduled Ancient monuments’ requiring permission for actions such as archaeological investigation or changes in land use. This covers only a fraction of archaeological heritage (approximately 20,000 sites).

The majority of archaeological remains are managed under the auspices of planning legislation, embodied in the Town and Country Planning Act (1990). Planning is undertaken at the regional authority level using guidance from central government via the National Planning Policy Framework (2012). This is built on an underlying ‘polluter pays’ principle with developers using consultants to evaluate archaeology prior to development with local authorities developing mitigation strategies. These are informed by regional development plans which outline priorities and highlight the current resource through Historic Environment Records. Many local authorities have developed Historic Landscape Character assessments to provide a framework on the nature and value of the landscape. Much of agricultural land use is situated outside planning regulations, however, which means that the vast majority of archaeology not under development threat is subject to little management oversight.

Areas of the landscape designated as National Parks or Areas of Outstanding Natural Beauty are provided statutory guidance on landscape management priorities, informed by Landscape Character Assessments. Via Neighbourhood plans and Local Landscape Character Assessments, the Localism Act (2011) aimed to situate local communities more directly in defining management priorities. The impact of these schemes appears to have been limited, however. There is relatively little incentive for the main practitioners of archaeology (developer-funded consultants) to undertake significant dialogue with other stakeholders, beyond those commissioning them. This means that the vast majority of archaeology is divorced from wider discourse.

Both Natural and Historic England aim to work together to ensure the historic environment is part of landscape management. Government infrastructure continues to foster divisions between the ‘natural’ and ‘cultural’, however, seen in the splitting of landscape concerns across the Department for Digital, Culture, Media and Sport (DCMS), Department for Environment, Farming and Rural Affairs (DEFRA) and Ministry of Housing, Community and Local Government (MHCLG). Disjuncture also exists in academia, with archaeology departments often more closely linked to history or classics than environmental studies or geography, with limited research cooperation.

**Figure 2.** Nature of landuse within the area encompassed by oppida, from a sample of 152 sites mainly in France (106), Germany (25) and Britain (11) (after Daval 2009).
**The English cases studies: Bagendon and Salmonsbury**

Two landscapes were chosen to represent the diversity of British oppida. Bagendon and Salmonsbury, Gloucestershire, although both located in the Cotswolds, are quite different in terms of their landscape character (Cotswold AONB 2002) as well as the pressures that face them. These include development, the decline of rural economies and changing population dynamics. Both are located in the Cotswold Area of Outstanding Natural Beauty which provides guidance on landscape priorities.

Situated on the interface between the Cotswold Hills and Thames Valley, the ‘polyfocal oppidum’ at Bagendon has around 4km of earthworks encompassing around 200ha. Its heyday was in the Late Iron Age (1st century BC–1st century AD) but most of the Iron Age remains are relatively ephemeral (Moore 2014). Only a small element is a Scheduled Ancient Monument (Fig. 3a). Central to the complex is Bagendon village with elements thought characteristic of Cotswold villages (vernacular architecture; drystone walls). The surrounding land comprises privately owned pasture and arable fields along with some woodland. Despite the significance of its archaeological heritage as the precursor to the regional Roman ‘civitas’ capital (which became modern-day Cirencester), and one of the largest archaeological monuments in western England, its relative invisibility means there are few visitors.

Salmonsbury, c. 24 km to the northeast, presents a different landscape. In a low-lying position close to the confluence of the Dikler and Windrush rivers, Salmonsbury is typical of enclosed oppida. Iron Age earthworks enclose an area of around 29ha (Fig 3b). The area includes evidence from a variety of other periods, including a Neolithic causewayed camp and Early Medieval ‘hundred’ (meeting place). The oppidum lies on the edge of the small town of Bourton-on-the-Water, famous for its vernacular architecture, which overshadows the earlier history of the area. The town has a population of over 3,000 and is a major tourist attraction with around 700,000 visitors per annum. The urban area encroaches on Salmonsbury which, since 2003, as part of Greystones Farm, has been under the management of the Gloucester Wildlife Trust (GWT), an environmental charity. This organisation has 3 staff at Greystones who co-ordinate landscape activities. As well as the Scheduled Ancient Monument of Salmonsbury, the area includes a Special Scientific Interest (SSSI) and an organic dairy farm. As at Bagendon, the archaeology is difficult to visualise and, in contrast to the number of tourists who visit Bourton-on-the-Water, Salmonsbury is relatively unvisited.

**Challenges for Bagendon and Salmonsbury**

Our case study landscapes reflect many of the successes and challenges within integrated landscape management in England. One of the most obvious aspects of integrated management is through Natural England ‘Countryside stewardship’. A significant proportion of the area

---

**Figure 3.** Landscape designation (including forms of stewardship agreement) around (a) Bagendon and (b) Salmonsbury (drawn by Tom Moore).
around both Bagendon and Salmonsbury, including much of the oppida, is under some form of stewardship agreement, although only at Salmonsbury does this have a specific historic environment option (Fig 3a, 3b). Of the two, greater integration in management can be seen around Salmonsbury where the Gloucestershire Wildlife Trust has created a unified management plan, incorporating farming, public access, wildlife and history. This reflects the national picture, where exemplars of integrated management which include archaeology are rare and restricted to organisations such as National Parks. Even around Salmonsbury, however, it is still the environmental significance which acts as the draw for local engagement.

In contrast, there is no unified approach to the Bagendon landscape and no forum through which values can be shared. The links which exist between different stakeholders, such as archaeologists and environmental groups, relate to personal connections, although some are facilitated by national agencies. The one facet of integrated management around Bagendon, ‘Countryside stewardship’, is focused on individual farms with no wider landscape agreements. To address this, recent integrated approaches have been trialled in the region but heritage has so far not been incorporated within these. With land entirely in private ownership, Bagendon lacks a landscape co-ordinator, beyond government agencies, meaning the needs of individual landowners often have primacy.

For the REFIT project this contrast in existing management has significant implications. At Salmonsbury, an existing organisation (GWT) exists as a potential co-ordinator to facilitate strategies to enhance awareness of archaeology within presentation and management strategies. At Bagendon the challenge is to explore how to develop knowledge exchange between stakeholders in a landscape without such organisations. For both landscapes, however, common issues exist, including a need to enhance awareness of the dynamism of landscapes, in order to contextualise modern landscape choices, and develop ways to engage all stakeholders. At present, despite the national significance of the archaeological remains, they do not act as a focus around which integrated management coalesces.

The Spanish framework

Spain’s approach to cultural landscapes varies. A system of devolved legislation on heritage and landscape ensures different approaches exist across the country. Cultural heritage management is regulated by national law and regional legislation. This law is based on the concept of Asset of Cultural Interest (Bien de Interés Cultural: BIC), which includes non-moveable heritage, movable heritage and intangible cultural heritage. It provides decentralization of the management of cultural heritage to autonomous regions (Comunidades Autónomas) under the guidance of the State. This ensures a fragmented approach with autonomous regions having developed their own legislation. National law covers three levels of heritage protection: (1) property with historical heritage status, (2) the General Inventory of Moveable Property and (3) the General Register of Property of Cultural Interest (moveable and immoveable). The Autonomous Communities have established additional levels of protection introducing special categories, concerning intangible heritage for instance. Regional laws on archaeological heritage govern BIC, which include archaeological sites, informing expropriation of the lands necessary for excavations and permission for archaeological investigation. They also govern programmes of conservation for archaeological sites and their environs.

Recently, preventive archaeology has emerged, rationalizing archaeological investigation and allowing for the designing of research models prior to development. Despite significant discussion on the role of preventive archaeology in Spain, there is currently a lack of data on its extent with each region displaying its own particular circumstances. These variations are due to different legal frameworks and the development of different management mechanisms. Despite the existence of elaborate statutory systems of planning and heritage management this does not, therefore, always guarantee effective landscape management. In general, the current practice in Spanish cultural heritage management is characterized by outstanding research and theoretical approaches contrasted with an often poor presence of these concepts within territorial strategies.

Landscape is taken into account by references to it in nature conservation laws, urban regulations and other provisions such as legislation on road development. Integrated policies on landscapes are, however, scarce. Protective strategies for listed heritage monuments focus largely on preservation while at the same time there is little protection for heritage susceptible to development. This approach often results in rigid protective regimes causing landowners and other stakeholders to oppose preservation regarding it as in danger of leaving the region vulnerable to economic stagnation.

Landscape management is considered in various areas. Central government deals primarily with protected property belonging to the state and manages public authorities and delegated bodies, while the Autonomous Communities focus on private property within their region. Most regions maintain a distinction between heritage and environmental protection, downplaying the integrated approach to landscape called for by the European Landscape Convention. This reflects a general division in Spain between heritage and the natural environment. Cultural heritage is legally conceived as a set of tangible and intangible assets which are considered worth protecting. Natural heritage is defined as environmental assets which have not been altered by humanity. This creates two different concepts, two sets of legislation, two different governing administrations, two forms of education and information and two completely different degrees of impact, strong for natural heritage but weak for cultural heritage. Natural and cultural heritage
do not share a common approach, but there are some points in existing legislation that enable the historic environment to be incorporated within landscape planning. The categories established by environmental laws such as national parks, natural parks and nature reserves have in recent years been emulated by cultural laws as cultural parks, cultural areas and archaeological parks. Here the convergence of concepts offers the potential to co-ordinate environmental and cultural management.

In recent years working groups have been set up to develop action plans to comply with the conventions entered into at an international level. This is leading to change, with a recent law of historical heritage in Andalucía including a category termed Cultural Landscape. In addition, the Institute of Cultural Heritage of Spain has developed a project titled the National Plan of Cultural Landscapes (2012). A number of research projects also exist within Spain which have sought to take a more integrated approach to landscapes involving local stakeholders and a variety of agencies in management strategies.

The Spanish case study: Ulaca

The situation at Ulaca reflects the relatively divided situation within Spanish approaches to landscape. Located in the province of Ávila, the oppidum Ulaca, encompassing approximately 70ha, was occupied in the Late Iron Age (ca. 300-50 BC) by people known as the Vettones who often erected stone statues (‘verracos’). After the Roman conquest it was abandoned with the foundation of the town of Ávila, which became a World Heritage site in 1985.

In some ways, Ulaca is an excellent example of a cultural landscape in which archaeological-historical and environmental elements are united on the basis of their protection and development. It was declared an Historic-Artistic Site in 1931 and protected as a BIC (Asset of Cultural Interest) in 1986. The archaeological zone of Ulaca (450ha; Fig. 4) was delimited and protected by the Law of Spanish Historical Heritage, leaving any restoration subject to the dictates of the Territorial Committee of Cultural Heritage. It is fenced and protected by an on-site guard paid for by the regional government and receives around 4,000 visitors per annum. It is part of the protected natural space (ENP) called “Sierra de la Paramera y Serrota”, within the network of natural areas of the Autonomous Community of Castilla y León, under the auspices of law 42/2007 on Natural Heritage and Biodiversity. Due to its rough terrain its main use is for extensive cattle grazing, organised by the local community.

Despite this combination of designations, the role of integrated management is less clear. Decisions about accessibility, building of infrastructure, land-use and the provision of funds for heritage presentation can encounter problems due to the lack of co-ordination mechanisms between levels of administration. This creates gaps between how policy makers, researchers, stakeholders and the community perceive what Ulaca heritage is and what measures are taken to manage it.

Figure 4. Plan of Ulaca oppidum in its wider landscape

There is, however, growing exploration of Ulaca’s archaeological heritage as the focus for landscape integration. In the 1990s different reconstruction programmes were created in the province of Ávila, thanks to a demand for ‘cultural tourism’. Consequently, the region has witnessed major archaeological excavations as part of an increasing awareness among the local population of the significance of local heritage as a cultural resource. This, in part, led to an exhibition Celtas y Vettones hosted by the council of Ávila which saw around 100,000 visitors. The European project Interreg III-A, led by the Regional Government of Ávila (Diputación Provincial), was decisive in recognition and dissemination of the archaeological heritage of the Iron Age oppidum through new excavations, restoration programs, and publications aimed at the general public, as well as the creation of a permanent exhibition in Ávila: Vettonia. A desire by heritage stakeholders to enhance local communities’ engagement with the resource of Ulaca is closely linked to the need for economic development in the region. The rationale is that visitors to cultural attractions tend to stay longer and spend more, meaning that increased visitors to Ulaca might allow for a diversification of the local economy and contribute to the preservation of the community’s heritage.

Despite these developments, a decline in local customs in agrarian communities, such as those around Ulaca, has led to a declining sense of identity in the face of globalization. The receptivity of people to better understand the past, which was previously often ignored, and the strategy of cultural tourism which places the oppida as the historical roots of the region, has created a kind of popular ‘vettonism’ (Ruiz Zapatero and Salas 2008). Implicit in this is the notion that there is a sense of shared concern and belonging expressed as a common value system. This has led to the development of a highly successful local festival (the Luna festival: Fig. 10), which attracts around 3,000 visitors each summer to Ulaca, organised primarily by the local mayor. Until recently this festival had little official endorsement and
there remains something of a tension that it has been created outside of archaeological authorities’ guidance. There are concerns, for example, over the impact of large numbers of visitors on the archaeological remains. This is a clear example of the ‘trade-offs’ heritage managers need to explore if Ulaca is to become foci for cultural landscape sustainability.

Challenges for Ulaca

The moderate success of local residents and authorities in increasing the value of Ulaca as a resource for tourism and as a source of local identity is something which might be enhanced. A landscape co-ordinator has emerged, in the form of the local mayor of Solosancho, but this is reliant on a dynamic individual and their relationship with authorities, residents and academics, rather than embedded in systems or practice. The challenge is for greater dialogue between stakeholders to consider management plans without governmental frameworks. The lack of engagement with natural environment authorities is particularly stark whilst the integration of other stakeholders has been limited. At present both the approaches by regional authorities and local people are almost entirely focused around the archaeological heritage but the potential to explore how heritage management might connect to aspects of managing the natural environment exists. Opportunities to make clear connections between contemporary agricultural practices, foodways, heritage and the natural environment abound but have, as yet, seen little development.

The French framework

In France, too, archaeological heritage and landscape issues are covered by legislation that depends on several ministries. Local authorities have little regulatory powers in this field but can support the State to enhance the value of heritage, as part of regional planning and tourism policies. The most significant elements of archaeological heritage benefit from a 1913 law which allows two levels of protection, as classified historical monuments (14,100 in 2015) or listed historical monuments (29,500) with work on or around these monuments strictly supervised. An amendment to the Heritage Code in 2016 defines ‘remarkable heritage sites’ (sites patrimoniaux remarquables) that include several older features: “towns, villages or districts whose conservation, restoration, rehabilitation or enhancement is in the public interest from the historical, architectural, archaeological, artistic or landscape point of view”. These sites (800 in 2016) are the subject of safeguarding or enhancement plans. Communities with remarkable heritage sites are organised into a national association (Sites & Cités remarquables de France) which allows exchange of experience and lobbying.

Archaeological heritage has benefited, since 1941, from specific legislation. These provisions include the need for State authorization to carry out excavations. Recently, monitoring of archaeological activity has been strengthened by the establishment of scientific advisory commissions at national and inter-regional levels. These have greatly contributed to improving the quality of archaeological research and field practice, as well as the publication of results. The pressure on archaeological heritage from development has also led to the establishment of a legislative framework for rescue archaeology, based on the polluter pays principle. This dictates that the State (via the Ministry of Culture) decides on the advisability of interventions likely to damage archaeological heritage and exercises scientific control. The conduct of archaeological work may be entrusted to approved operators, in practice usually the National Institute for Preventive Archaeological Research (INRAP), units belonging to local authorities or independent firms.

Landscapes are taken into account in environmental and urban planning legislation. Their protection mainly results from a 1930 law which allows two levels of protection, classification or inscription, for “natural monuments and sites whose conservation or preservation is of general artistic, historical, scientific, legendary or picturesque interest”. Today, there are about 6,700 classified or listed sites, covering c. 4% of France. Over the years, there has been a tendency to increase the size of the protected areas, usually motivated by recognition of the landscape’s cultural and environmental quality.

The 1993 law about ‘the protection and enhancement of landscapes’ aims to protect more extensively landscapes, whatever their importance or type. The law, later updated to include the definition of landscape used in the European Landscape Convention, provides for a wide variety of measures to protect space for reasons of landscape quality or their important biodiversity. These measures most often take the form of contractual incentive schemes, such as ‘regional natural parks’ (parcs naturels régionaux), or special provisions in documents guiding land management by local authorities. The policy of the Grands Sites de France, initiated in 2002, encourages local authorities to take charge of the sustainable management of landscape areas of high value and to experiment with methods of integrated management. This policy is an example of the reflections taking place within the Ministry of the Environment regarding the notion of landscape as a lever to develop sustainable regional projects, both to mobilize all stakeholders through their interest in their lived environment, and to develop territorial projects through the transversality of reflection on the future of landscape requires (e.g. the Paysages Territoires Transitions research action in which Bibracte is involved).

Archaeological heritage may benefit from measures designed to protect areas for their landscape quality or biodiversity, even if heritage is rarely emphasised as the grounds for protection. In this respect, the primacy of archaeology as the reason for protection of Mont Beuvray (Bibracte) according to the 1930 law is exceptional. Similarly, local urban plans, which are an obligation of local authorities, must incorporate consideration of the pre-
sservation of cultural heritage but, in practice, they rarely take into account buried archaeological heritage. Finally, there is no provision specifically concerned with the risks that agricultural work poses for buried archaeological heritage, although it is a major factor in destruction of archaeological remains.

In summary, France has been concerned with moving from an archaeology of rescue to a genuine policy which preserves archaeological heritage. It has been most successful in establishing an effective framework for studying remains threatened by development, but archaeological heritage remains insufficiently integrated in management and there remains considerable scope for taking archaeological heritage into account when developing landscape projects. In the same manner, decisions to allow the destruction of archaeological sites after their scientific recording are still fully in the hands of experts and never shared with the wider community.

The French case study: Bibracte

Amongst our case studies, Bibracte is already the most integrated in terms of management. The oppidum of Bibracte is situated on Mont Beuvray, Burgundy, situated within the Parc naturel régional du Morvan (c. 173,000ha), an upland region with low population density and an economy based on cattle breeding, forestry and, to a much lesser extent, tourism. Bibracte dates to the late 2nd to 1st century BC, with 12km of fortifications and is spread over 200 hectares. Its excellent preservation and historical significance, as a place where Julius Caesar wrote his Commentaries on the Gallic War, mean that it has a focal place in French national identity.

In addition, because of its location within former President François Mitterrand’s (1916-1996) original constituency, in 1984 an archaeological research programme was initiated and the site was included on the list of Grands Travaux de l’Etat in 1989. A management structure was established, bringing together state and local organisations to implement a significant programme of investments, establishing a public property of 950 hectares, and creating facilities which were inaugurated by Mitterrand in 1995. The site roles within the landscape: as a natural and historic site, a research centre, and an archaeological museum are managed by one public body – an établissement public de coopération culturelle (EPCC). This type of public organisation was established by legislation in 2001 to allow significant cultural facilities, such as museums, to be run as partnerships. Under this system, the facility is managed by an independent organisation, with policy and financing arranged by a governing board which includes representatives from the founding bodies. This type of management structure has advantages in combining the policies and resources of all the different bodies involved, and in creating a management structure where roles and responsibilities are clearly distributed between the elected representatives (who define overall strategy) and the director (who has responsibility for its operational running).

As well as its archaeological significance, Mont Beuvray has significant environmental value, rich in beech forests and panoramic viewpoints which open onto protected landscapes. Today Bibracte is encompassed by a variety of heritage and natural environmental protection (Fig. 5). It is a classified Monument Historique (encom-

---

**Figure 5.** Designations of the landscape around Bibracte.
passing 135 ha) and classified according to the 1930 Act because of its historic and picturesque significance (covering 1478 ha). Since 2014, it has also been a designated Natura 2000 area, covering c. 1004 ha. Since 2008, Bibracte has been a Grand Site de France. This does not offer specific protection but aims to ensure an integrated and sustainable management programme the classified site and its landscaped setting (buffer zone) which extends across the territory of ten villages (including ca. 25,000 ha and 2,500 inhabitants).

Bibracte functions as a place of fieldwork for researchers, from a dozen or so countries, and as an archaeological park. It endeavours to operate as an experimental site for archaeological work, including museography and research methodology, as well for integrated heritage management with the hosting of training courses and international workshops. The Bibracte museum exhibits the results of archaeological research on the site placing it in wider context. The museum and Centre archéologique européen host a diverse set of visitors including researchers, students and heritage professionals participating in scientific programmes. They include several hundred individuals and complete around 8,000 working days at Bibracte per year. The museum has c. 44,000 visitors per year. School trips account for a significant proportion with 8,000 children spending at least one day at Bibracte. The remaining visitors comprises 40% from the local area, 30% from other regions of France, and the rest from other countries, primarily the Netherlands and Belgium.

**Challenges for Bibracte**

The existence at Bibracte of a clear landscape co-ordinator which already integrates aspects of national and local government, academic researchers, tourism specialists and environmental experts means it is far and away the most integrated of our case studies. Bibracte still faces significant challenges, however. Bibracte is located in an upland area which has suffered from significant depopulation since the late-nineteenth century and has seen major agricultural decline, with pine plantations replacing pasture, drastically transforming the landscape. This is due to a combination of extensive low value-added agro-pastoral production mobilising little labour and drastic changes in forest physiognomy due to widespread highly mechanized production systems that favour exogenous resinous species over hardwoods.

Within this context, Bibracte exists in the role of a cultural centre for a local population with very few other cultural opportunities. A concerted effort is, therefore, being made to produce non-archaeologically related events related to artistic creation or contemporary issues, welcome artists in residence and hosting multi-disciplinary festivals. Despite this integration of management, only recently has Bibracte’s management begun to explore the views and values of non-specialist stakeholders (the methods for doing which are explored below). In the 1980s Bibracte had an essentially scientific ambition, driven largely by the State in the form the Ministry of Culture. The 1990s saw the rise of cultural ambitions (including opening the museum) and the involvement of local authorities. In the 2000s, management recognised the importance of a landscape approach to highlight and make understandable the archaeological site which is largely perceived by its visitors as a vast “natural” space. In particular, the award of the Grand Site de France label in 2007 (and renewal in 2013), has been part of a growing dialogue with the Ministry of the Environment. In the spirit of the European Landscape Convention, the ambition is presently to build from Mont Beuvray a sustainable territorial project based on a harmonious development of its economic activities (agriculture, forestry and amenity economy) with the involvement of local stakeholders, using the mobilising and integrative capacity of the notion of landscape. This project is being carried out in close partnership with the Parc naturel régional du Morvan, and involvement of a multidisciplinary consortium of researchers which role is to assess the effectiveness of the process, especially the possibility of creating a heritage community around a shared vision of the evolution of the shape of the territory. As such, Bibracte has now entered a new stage in its history based on a paradigm shift.

Through an integrated approach Bibracte is exploring the trade-offs necessary to manage its landscape. Recognising, for example, that the beech forest on Mont Beuvray is an integral aspect of its landscape character, the management plan recognises a need to ensure its sustainability whilst using woodland clearance to make the archaeology more visible to a public audience. Working with a landscape architect this integrates archaeological preservation, display whilst enhancing the natural environment. These guidelines led to the establishment of a long-term forestry project with the aim of opening up the topography of the Iron Age monument and creating a set of development scenarios. Such an approach moves away from simply privileging heritage, recognising it as just part of the cultural landscape over which dynamic choices need to be made.

**Overview: comparative challenges**

Our case studies provide a snap shot of particular ways oppida are managed in different settings. Reflection on the current situation highlights the diverse ways in which oppida are integrated into management and the ways in which stakeholders experience them. This relates both to fundamental differences in national and regional government policies and to the extent to which these embrace the concepts of the ELC. It also relates to local factors such as levels of engagement between stakeholders and role of management actors. Despite the variation, a number of common themes and challenges emerge. These represent challenges and opportunities for REFIT to develop strategies to integrate oppida heritage within a landscape perspective.
Disconnection and structural division

A common factor across our case studies is the current lack of awareness by many stakeholders of existing frameworks for landscape management. Despite all four case studies being situated in rural areas there is a surprisingly limited awareness of the juridical or management basis for current management. From all our case-studies, surveys of stakeholders revealed a surprising commonality in how few could identify key management organisations or the mechanisms by which the land was managed (Fig. 6).

In England, the extent to which Stewardship was used to manage the surrounding territory was poorly understood, even by landowning stakeholders. Even around the most actively engaged manager, Bibracte, only around 25% of local stakeholders surveyed (n=420) were aware of how it was managed and its legal protections.

This lack of awareness appears to relate largely to how the landscape is presented, dividing information on heritage, geology, ecology and agronomy, ensuring relatively little knowledge transfer between stakeholders. Our assessment of the current situation at all four case studies emphasises that whilst information for some aspects of these landscapes exists (Fig. 7), this tends to be restricted to specific spheres (such as solely ecological) with little easily accessible information on current land-use or the biography of landscape character. At some case studies, such as Bibracte, discussion with regional, elected representatives reveal this disconnect is leading to limited investment of communities in land strategy issues. This encourages municipalities to have a fatalistic attitude towards changes in land ownership, for example, which can lead to major changes in land management.

One of the potential reasons for stakeholder disconnection from landscape management, witnessed in all three countries, is how approaches to landscapes continue to foster division between the ‘natural environment’ and cultural heritage. Despite the ELC’s emphasis on integration, in practice there remains significant disconnection. There are signs of change, for example in the cross-disciplinary approach espoused by the Grands Sites de France policy, of which Bibracte is a part; attempts to enhance historic environment within countryside stewardship in England and regional approaches to cultural landscape in Spain. However, the impact of structural separation should not be under-estimated in creating both conceptual and information barriers within and between stakeholders. A variety of approaches across Europe are challenging such division with increasing numbers of integrated landscape initiatives emerging from the ‘bottom-up’ but archaeology as integral to these remains rare. More encouragingly, despite these divisions and a general unfamiliarity with the concept of ‘cultural landscape’ amongst our stakeholders, interviews with stakeholders revealed that, once explained, the majority regard it as reflecting their own appreciation of the integrated nature of landscapes. It thus has the potential to act as a frame of reference which non-specialists can ‘buy into’.

Landscape coordination and integration

Transcending structural divisions to enhance integration appears best achieved through the existence of ‘landscape coordinators’. In our case studies the nature of these varies. From its earlier focus on heritage, Bibracte EPPC has developed as a space with which to connect national and regional agencies, academics and political actors. Elsewhere, coordination exists at Salmonsbury in the form of the Wildlife Trust, and at Ulaca, more nascent, in the form of the mayor. We termed these ‘leaders’ or co-ordinators, but they might just as well be identified as landscape actors (or stakeholders) who have the ability to act as ‘connectors’ or hubs around which others can coalesce or interact. The expertise or existing role of these stakeholders is less important than in being one to which many other stakeholders are connected, or has the capacity to connect. At Bibracte, the driving force in this regard coincides with the heritage stakeholder which has recognised

---

**Figure 6.** Proportion of stakeholders surveyed using questionnaires who were unable to identify any law or designation used to manage the landscapes of the 4 case study oppida.

**Figure 7.** Photo of information panel at Salmonsbury displaying only ecological information.
the challenge to broaden its remit to the wider cultural landscape. Within those areas where no major museum or heritage stakeholder is present, at Ulaca and Salmonsbury, the potential comes from working with other, more permanently established stakeholders (the Wildlife Trust and local community, respectively). Identifying such co-ordinators provides the potential for those working on Iron Age oppida to work co-productively to facilitate engagement with other stakeholders. Building on existing stakeholder networks we can engage stakeholders in the archaeological heritage, which need not focus on the Iron Age archaeology of oppida but use this as lens to explore broader issues on landscape. The one landscape where no coordinator exists, Bagendon, is the landscape with the most limited integration at present and challenges us to consider how to create a space for dialogue. Our interviews suggest one possibility is using the social capital of individual landowners. The importance of individuals’ social capital in connecting stakeholders is being recognised but the potential for archaeology to act as a lever in developing such capital has only begun to be explored. The high value placed on cultural heritage in these landscapes suggests, however, it has the potential to be used to engage and enable stakeholders. The visibility and social resonance of the oppida at Bibracte, Salmonsbury and Ulaca in particular have the potential to act as levers for engagement in wider landscapes discourse.

**Landscape visions and landscape dynamism**

A trend across our case studies is a limited appreciation by most stakeholders of the ways in which landscapes have emerged in the past and the nature of choices over landscape change in the present. In some areas, such as the Cotswolds there is a perception of a static landscape. At Bibracte, by contrast, there is recognition of current transformations but a lack of appreciation on how to influence these changes. Bibracte is an example of the paradoxical nature of engagement in landscape dynamism; most stakeholders are aware of the changes that the Morvan has undergone since the beginning of the 20th century and these are a source of anxiety for many inhabitants. At the same time, projects to explore alternative evolutions of the landscape, which have largely been carried out by work at Bibracte, remain barely recognised by local stakeholders, even though the subject is included in the permanent exhibition at the museum and is addressed by the visitor guides to the site. This gap between perceptions of short-term and long-term change coincides with a distinction in stakeholders’ perception of the landscape, distinguishing between the heritage of Mont Beuvray, which enjoys national recognition, distinct from their own daily environment, which they find difficult to consider as also of heritage value. The challenge for a sustainable territorial project around Bibracte is to ensure that these two perspectives on landscape, one imposed “from above” (by the state and the experts) and one experienced “from below” by the local stakeholders, coincide.

Review of our case studies revealed that none had yet explored stakeholder views of the landscapes and integrated this into management. In those where it had been taken into account (e.g. Cotswolds) this was through generalised regional or national surveys. Deeper understanding of the motivations and values of all stakeholders is important in underpinning any integrated approach. For REFIT, we embarked on surveys and interviews to explore stakeholders’ perceptions of landscape. Recognising the importance of exploring the landscape through visual means this also involved mind maps to explore the extent and nature of the perceived landscape. There are, of course, a range of scales at which landscapes need to be understood and managed but our engagement is finding that most stakeholders engage with it at a relatively localised scale. It is at this scale, around landscapes that feel familiar and comfortable, whilst also focused around our heritage assets, the oppida, that engaging stakeholder communities is likely to be most effective in acting as forums to discuss larger issues.

To facilitate greater engagement in landscape choices we have developed various strategies. Bibracte has sought to engage local stakeholders on landscape issues through interviews and collective workshops, both indoors and through landscape reading workshops in the field (Fig. 8). These sessions have made it possible to coproduce a diagnosis of what characterises this unique landscape and identify the risks of landscape degradation; a scheme now validated by the local authorities.

Despite these successes these were insufficient in ensuring that the region’s stakeholders became fully engaged in determining landscape issues. To address this, as part of the REFIT project, two interrelated avenues have been explored with promising preliminary results. These recognise that new aspects of the landscape might need to be identified with which to harness the engagement of local stakeholders. Field workshops conducted at the community level revealed a strong interest by local people in the territory’s network of dense and ancient trackways. Examination of 19th century cadastral maps revealed that this network has changed little over the last two centuries. It was discovered that these trackways could act as a lever for engagement, representing a shared interest amongst diverse stakeholders and provide a structuring role in reflections on the future of the landscape. The trackways have the advantage of representing a concrete manifestation that embodies more abstract notions of landscape and experience. This approach reflects projects elsewhere which are recognising that relatively overlooked aspect of landscape heritage, especially those that have long structured a region as a proper common service, whether trackways, irrigation networks or waterways have the potential to unify stakeholder interests.

In the other case studies different approaches have been taken to engage stakeholders focusing on understanding landscape biographies. Around Bagendon and Salmonsbury, where farmers had limited engagement...
with wider perspective on landscape change and many residents revealed perceptions of landscapes as largely static, different engagement approaches were developed. These included participatory augering events (Fig. 9) with local farmers, residents and volunteers from the wildlife trust. Building on farmers’ and wildlife group members’ existing interests in how soils are formed and what species are used to identify past landscapes, these explored how archaeologists understand landscape change, explore past anthropogenic impact, and relate this to modern choices in land use. Many participants have emphasised how these events transformed their understanding of the changing nature of these landscapes:

“I thought I had a long view of the landscape but I realise it was just a short one... what we have been shown today is what an effect previous generations have had on the landscape” farmer, Bagendon.

“this has informed us how the landscape has been formed by natural and human activity over many generations and informs us how that links to what we are doing today” landowner, Bagendon.

At Ulaca, by contrast, the existing Luna festival (Fig. 10) was used, through workshop sessions and presentations, organised by REFIT, as a focus for engaging local stakeholders in discussion on choices in managing the landscape. In different ways, our work on oppida is thus seeking to focus less on disseminating knowledge from heritage stakeholders but to facilitate the possibility of developing new “bottom-up” approaches in these landscapes based on the highlighting their singularities. All of these approaches use the presence of the oppida to create forums, acting as hubs of discussion, but recognising the need to engage stakeholders through media that resonate with them and via forms of heritage that connects multiple stakeholders allowing the exploration of wider landscape concerns. Previously, in all our case studies, the relationship between the history of the territory and modern land use were not explicitly explained to non-specialist stakeholders. By taking a biographical approach to landscape we sought to mobilise the past to engage local communities in appreciating their place in longer landscape biographies ensuring more informed choices about managing existing and future landscapes. Working coproductively with landscape co-ordinators, archaeology has the potential to demonstrate the dynamic nature of landscape biographies and the interaction of social, economic, ecological and aesthetic forces in creating landscape character.

Coproduction of landscape visions

Recognition of the need to connect oppida heritage to wider discourse on landscape means coproductively working with other stakeholders to incorporate information on archaeological heritage as part of its presentation to a wide set of stakeholders. Through the engagement events discussed above local stakeholders (farmers, residents, ecologists etc) could be accessed, but to ensure a greater reach to residents and other communities our analysis suggested other engagement tools were required. This included larger engagement events, for example at Salmonsbury, open-days were held (called ‘Love your Landscape’) which included participatory augering workshops to explain how archaeology can understand landscape change. These were coproduced with the Wildlife Trust, ensuring that heritage, ecology and agronomy were not seen as distinct aspects but integral to the landscape. To reach more diverse audiences and ensure sustainability videos of these events were created to enable greater numbers of stakeholders to engage with these landscapes remotely, as well as physically. Around Bibracte, open days held at local farms (‘La recherche est dans le pré’) brought researchers from different disciplines (archaeology; agronomy; ecology; anthropology) together to explain their work to local people. This engaged local residents and farmers in their own environment, rather than in the research centre context, through presentations that did not isolate heritage from other landscape aspects.
To foster greater awareness of the integrated nature of these landscapes we implemented the creation of downloadable landscape guides for all case studies. Coproduced with stakeholder organisations (the Wildlife Trust in the UK; Parc naturel régional du Morvan in France) these guides combine information on archaeology, ecology and modern land-use, incorporating perspectives (in the form of quotes) from relevant stakeholders (Fig. 11). These are formed around designated pathways with set information points (often at particular viewpoints) extemporising on different aspects of the landscape. The intention is that these will act as walking guides and sources of information which engender greater reflection on landscapes than subject-specific information. In addition, Bibracte has developed longer booklets (in multiple languages) outlining how the archaeological heritage is connected to the wider landscape. This also includes excerpts from stakeholders reflecting on their engagement with Bibracte and the landscape. To ensure wider reach of these resources, digital interactive guides have also been produced for each landscape. These include videos providing perspectives from a variety of stakeholders, as well more in-depth information on archaeology, ecology and current landuse. Through dissemination of these resources via other stakeholders (the AONB and Wildlife Trust in the UK) we are likely to ensure greater use of these resources and cut across engagement with non-heritage stakeholder communities.

All of our engagement approaches emerge from recognising that only by working coproductively with other landscape stakeholders are we likely to embed archaeology in landscape biographies. The engagement approaches undertaken at Bibracte, in particular, reveal that for coproduction to be successful, they can be inspired by reflection on historical approaches to land management. In this, we have been inspired by reigniting and operationalising notions of landscapes as ‘commons’, a concept largely forgotten in France since the revolution, in its potential to engage stakeholders as policy actors. This concept emphasises how landscapes are co-created, rather than ascribed, and that local stakeholders are integral to their character.

Conclusions

Our assessment of the situation of integrated landscape management in our case studies emphasises the need to embed heritage and archaeology within broader approaches to landscape whilst engaging with a broad spectrum of stakeholders. Through assessing the current levels of integration we have recognised that there is significant, largely untapped potential for archaeology and specific heritage assets, like oppida, to be not just integrated but act as levers for consideration of the changing nature of landscape. REFIT is attempting to develop this through novel engagement events and creating spaces within the landscape to integrate stakeholders in landscape decisions. This process is an ongoing one with many of our activities part of longer-term strategies, for example at Salmonsbury and Bibracte, and is already leading to a more integrated presentation of our landscapes. Oppida, whilst typifying many landscape issues, represent just one case study in how archaeological assets can act as foci in coalescing stakeholders on landscape issues. Other heritage elements of landscape are likely to face similar issues and have similar potential to be explored as levers in enhancing integrated landscape management.

REFIT emphasises that through coproduction with existing landscape coordinators there are pathways for ensuring archaeology is not perceived as a marginal ‘cultural ecosystems service’ but an integral aspect of the landscape. This is partly about raising the profile of frequently overlooked archaeological heritage, such as the oppida, but more crucially situating such monuments as part of a discourse on landscape biographies. Archaeology has the potential to act as lever to understand past landscapes, anticipate future changes and codefine the desirable future for landscapes of which all stakeholders are inheritors and contemporary participants. To do so, we need to act coproductively with other stakeholders to ensure that archaeologists do not leave landscapes to other disciplines.
